POZZOLANS
(Supplementary Cementitious Materials)
The name Pozzolan comes from the town Pozzuoli, Italy.

Ancient Romans (~100 B.C.) produced a hydraulic binder by mixing hydrated lime with soil (predominantly volcanic ash).

Horasan mortar, mixing lime with finely divided burned clay, is extensively used by Ottomans.

Nowadays, the word pozzolan covers a broad range of natural and artificial materials.
Pozzolan

a material that, when used in conjunction with portland cement, contributes to the properties of the hardened concrete through hydraulic or pozzolanic activity, or both.

- Natural (Volcanic ash, volcanic tuff, pumicite)
- Artificial (fly ash, silica-fume, granulated blast furnace slag)
Pozzolan

Siliceous or aluminous material, which in itself possesses little or no cementitious value but will, in finely divided form and in the presence of moisture, chemically react with calcium hydroxide $\text{Ca(OH)}_2$ to form compounds possessing hydraulic cementitious properties.
POZZOLANIC REACTIONS

Calcium Hydroxide + Silica + Water → “Calcium-Silicate-Hydrate” (C-S-H)

C-S-H provides the hydraulic binding property of the material.

Pozzolanic Activity: Capacity of pozzolan to form alumino-silicates with lime to form cementitious products. (How good how effective the pozzolan is!)
FACTORS THAT AFFECT THE ACTIVITY OF POZZOLANS

1) SiO$_2$ + Al$_2$O$_3$ + Fe$_2$O$_3$ content

2) The degree of amorpheness of its structure

3) Fineness of its particles
1) $\text{SiO}_2 + \text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3$

- The greater amount of these, the greater its activity.
- ASTM C 618 & TS 25 $\rightarrow$ min “$\text{SiO}_2+\text{Al}_2\text{O}_3+\text{Fe}_2\text{O}_3$” for natural pozzolans $> 70\%$
- Fly Ash - ASTM
  - Class C $\rightarrow$ from lignitide or subbituminous coals
    ($\text{SiO}_2+\text{Al}_2\text{O}_3+\text{Fe}_2\text{O}_3 > 50\%$)
  - Class F $\rightarrow$ from bituminous coals and
    $\text{SiO}_2+\text{Al}_2\text{O}_3+\text{Fe}_2\text{O}_3 > 70\%$
- Silica fume $\rightarrow$ $\text{SiO}_2 \approx 85-98\%$
- Blast Furnace Slag $\rightarrow$ $\text{SiO}_2 \sim 30-40\%$
  $\text{Al}_2\text{O}_3 \sim 7-19\%$
  $\text{CaO} \sim 30-50\%$
2) Amorphousness

- For chemical reaction → pozzolans must be amorphous
- Volcanic ash, volcanic tuff, fly ash, silica fume are all amorphous by nature.
- Clays → contain high amounts of silica & alumina but have a crystallic structure! (Do not possess pozzolanic activity)
  - However, by heat treatment, such as calcining ~700-900°C crystallic structure is destroyed & a quasi-amorphous structure is obtained.
2) Amorphousness

- Clay → does not possess pozzolanic property
- Burned clay → possess pozzolanic property
- Blast furnace slag → contain high amounts of silica, alumina & lime.

However, if molten slag is allowed to cool in air, it gains a crystal structure. * do not possess pozzolanic property.

However, if it is cooled very rapidly by pouring it into water, it becomes a granular material & gains amorphousness. * possess pozzolanic property.
3) Fineness

- Pozzolanic activity increases as fineness increases.
- Volcanic ash, rice husk ash, fly ash, condensed silica fume are obtained in finely divided form.
- Volcanic tuff, granulated blast furnace slag & burned clay must be ground.
DETERMINATION OF POZZOLANIC ACTIVITY

- Pozzolanic activity is determined by "strength activity indexes"

- Six mortar cubes are prepared (ASTM)
  - "Control Mixture" 500 g portland cement + 1375 g sand + 242 ml water
  - "Test Mixture" 400 g of portland cement + 100 g of pozzolan + 1375 g of sand + some water for the same consistency
Compressive testing at 7 or 28 days

Strength Activity Index (SAI) = \( \frac{A}{B} \times 100 \)

- \( A = f'_c \) of test mixture
- \( B = f'_c \) of control mixture

ASTM C 618 → SAI ≥ 75%
CHEMICAL COMPOSITION OF POZZOLANS

- Silica Fume is mostly SiO$_2$
- G. G. Blast Furnace Slag $\rightarrow$ high amounts of CaO (self-cementitious)
- Class C Fly Ash has CaO (self-cementitious)
### Chemical Analysis of Typical Fly Ash, Slag, Silica Fume, Calcined Clay, Calcined Shale, and Metakaolin

Typical Amounts of Pozzolans in Concrete by Mass of Cementing Materials

- **Fly ash**
  - Class C: 15% to 40%
  - Class F: 15% to 20%

- **Slag**: 30% to 45%

- **Silica fume**: 5% to 10%

- **Calcined clay**: 15% to 35%
  - Metakaolin: 10%

- **Calcined shale**: 15% to 35%
**REQUIREMENTS FOR AN ACCEPTABLE QUALITY OF POZZOLAN**

- **TS 25** → Natural Pozzolans
- **TS 639** → Fly Ash
- **ASTM C 618** → For Natural Pozzolan & Fly Ash

USES OF POZZOLANS

1) Direct use of Pozzolan by Mixing it with Calcium Hydroxide
   Extensively used in ancient times but not very common now.

2) Use of Pozzolan in Producing Blended Cements
   Grinding “Clinker+Pozzolan+Gypsum” → Portland Pozzolan Cements Extensively used

3) Use of Pozzolan as an Admixture
   “Cement+Pozzolan+Aggregate+Water” → Concrete
